The information provided in this content is not intended for distribution to, or use by any person or entity in any jurisdiction or country where such distribution or use would be contrary to law or regulation or which would subject us to any registration requirement within such jurisdiction or country.

Hypothetical performance results have many inherent limitations, some of which are mentioned below. No representation is being made that any account will or is likely to achieve profits or losses similar to those shown. In fact, there are frequently sharp differences between hypothetical performance results and actual results subsequently achieved by any particular trading program and method or software. Old Tree publishing by users download and/or use of this report is indemnified fully by any such user in any and all and each respect possible.

One of the limitations of hypothetical performance results is that they are generally prepared with the benefit of hindsight. In addition, hypothetical trading does not involve financial risk and no hypothetical trading record can completely account for the impact of financial risk in actual trading.

For example, the ability to withstand losses or to adhere to a particular trading program or system in spite of the trading losses are material points that can also adversely affect trading results. There are numerous other factors related to the market in general or to the implementation of any specific trading program, which cannot be fully accounted for in the preparation of hypothetical performance results. All of which can adversely affect actual trading results.

We reserve the right to change these terms and conditions without notice. You can check for updates to this disclaimer at any time by visiting www.rapidresultsmethod.com.

Your use and reliance on the materials is based on your acceptance of such Terms and Conditions and policies as appear on the site.

Early Entries

The DPI is an amazing indicator, and now we are going to use it to find a way into the market before the histogram turns the proper color.

As you know, a yellow histogram means buy and a red histogram means sell.

There are times when the turning of the histogram color delays what we might consider a terrific entry. If we wait for the histogram to turn yellow for a buy trade, we might end up avoiding the trade because the market has moved too far to make the trade realistically winnable.

Once the Histogram turns the right color, the market might have moved so far that the stop loss becomes too large and the market is too far away from the moving average. Taking a trade at this point becomes less desirable.

We are going to look at the DPI in a way that will allow us to enter the market in a timelier manner.

We will be able to enter along trade while the DPI histogram is still red, and enter a short trade while the DPI histogram is still yellow.

For this we will need the opened DPI. The most important feature is the 0 line.

The Early Entry will...

1. Rarely occur with Ribbon Trade setup.
2. Occasionally occur on a Ghost Trade setup.
3. Frequently occur on a Shark Trade setup.

Because of its frequency on a Shark Trade setup, we will use this in our examples.

Shark Trade

Let's quickly overview the Shark Trade setup.

The indicators used to find a Shark trade is are the 34 EMA and the 89 EMA. This is considered the "long term trend". The market will like to move the farthest in the direction of the long term trend.

Most of the time, a Shark Trade setup will occur in an Unordered Phase, and this can make the market movement sideways, but when the market is moving, the Shark trade can move the market quite far.

Below you can see the Shark Trade. The Moving averages are initially in the Trending Phase order, the price pulls back and touches the 89 EMA. After that we see price close below the 34 EMA. This is a Shark Trade Setup.

The Shark Trade pulls the 13 EMA in between the 34 EMA and the 89 EMA, this is the Unordered Phase. We will generally want to stay away from this phase, but the early entry signal will help us get into this trade even during an Unordered Phase.

This Early Entry will also help us get the jump on the 13/34 crossover trade that is close to follow.

Early Entry Short Setup

There are a series of steps in the Early Entry. These steps will apply to the Ribbon Trade, the Ghost Trade and the Shark trade. Here they are:

1. The market will be in a technical down-trend, also called the Trending Phase.
2. As price pulls back, the DPI will change from red to yellow. Both the Lead and Follow line will cross above the 0 line and there will be some green nested histogram showing.
3. As the Ribbon/Ghost/Shark setup occurs and we get the proper cross past the appropriate moving average and the PSAR is on the correct side.
4. The green nested histogram disappears. The DPI may still be the wrong color (yellow), but as long as the nested histogram vanishes as either the Lead or Follow line touches or crosses the 0 line, we can consider a trade.

Early Entry Long Setup

There are a series of steps in the Early Entry. These steps will apply to the Ribbon Trade, the Ghost Trade and the Shark trade. Here they are:

1. The market will be in a technical up-trend, also called the Trending Phase.
2. As price pulls back, the DPI will change from yellow to red. Both the Lead and Follow line will cross below the 0 line and there will be some green nested histogram showing.
3. As the Ribbon/Ghost/Shark setup occurs and we get the proper cross past the appropriate moving average and the PSAR is on the correct side.
4. The green nested histogram disappears. The DPI may still be the wrong color (red), but as long as the nested histogram vanishes as either the Lead or Follow line touches or crosses the 0 line, we can consider a trade.

Below is an example of a Shark Trade / Ghost Trade that we would not have taken. The Green Nested Histogram was still present, so there was no early entry available.

We want to be sure that we are still taking these trades in a market environment that is favorable to taking trades. If the market is moving sideways or is choppy or slow or spiky or any of the things we don't want to trade, we will find there will be more of these Early Entry setups with most of them not working out.

Early Entry on Ribbon Trades

These are rare. Finding an Early Entry on a Ribbon Trade setup doesn't happen very often. They are actually extremely hard to find as an example, but the rules will still apply. As the green histogram disappears, the entry signal applies.

Early Entry on Ghost Trades

The Ghost Trade setup occurs in a Trending Phase. The price pulls back to touch the 34 EMA and then the price continues to move back into the direction of the trend. Once the price closes past the 13 EMA we have a signal. Of course we still wait for the PSAR to be on the correct side of the market, and in this example, the DPI will present us with an early entry.

The Early Entry on a Ghost Trade setup is a little more frequent, but still not easy to find. When they do happen, you will find that they usually coincide with a Ribbon crossover trade. The Ribbon will usually cross against the trend and then as the Early Entry signal happens, the Ribbon will also crossover back in the trending direction.
